Background

Figures from references [1-2]

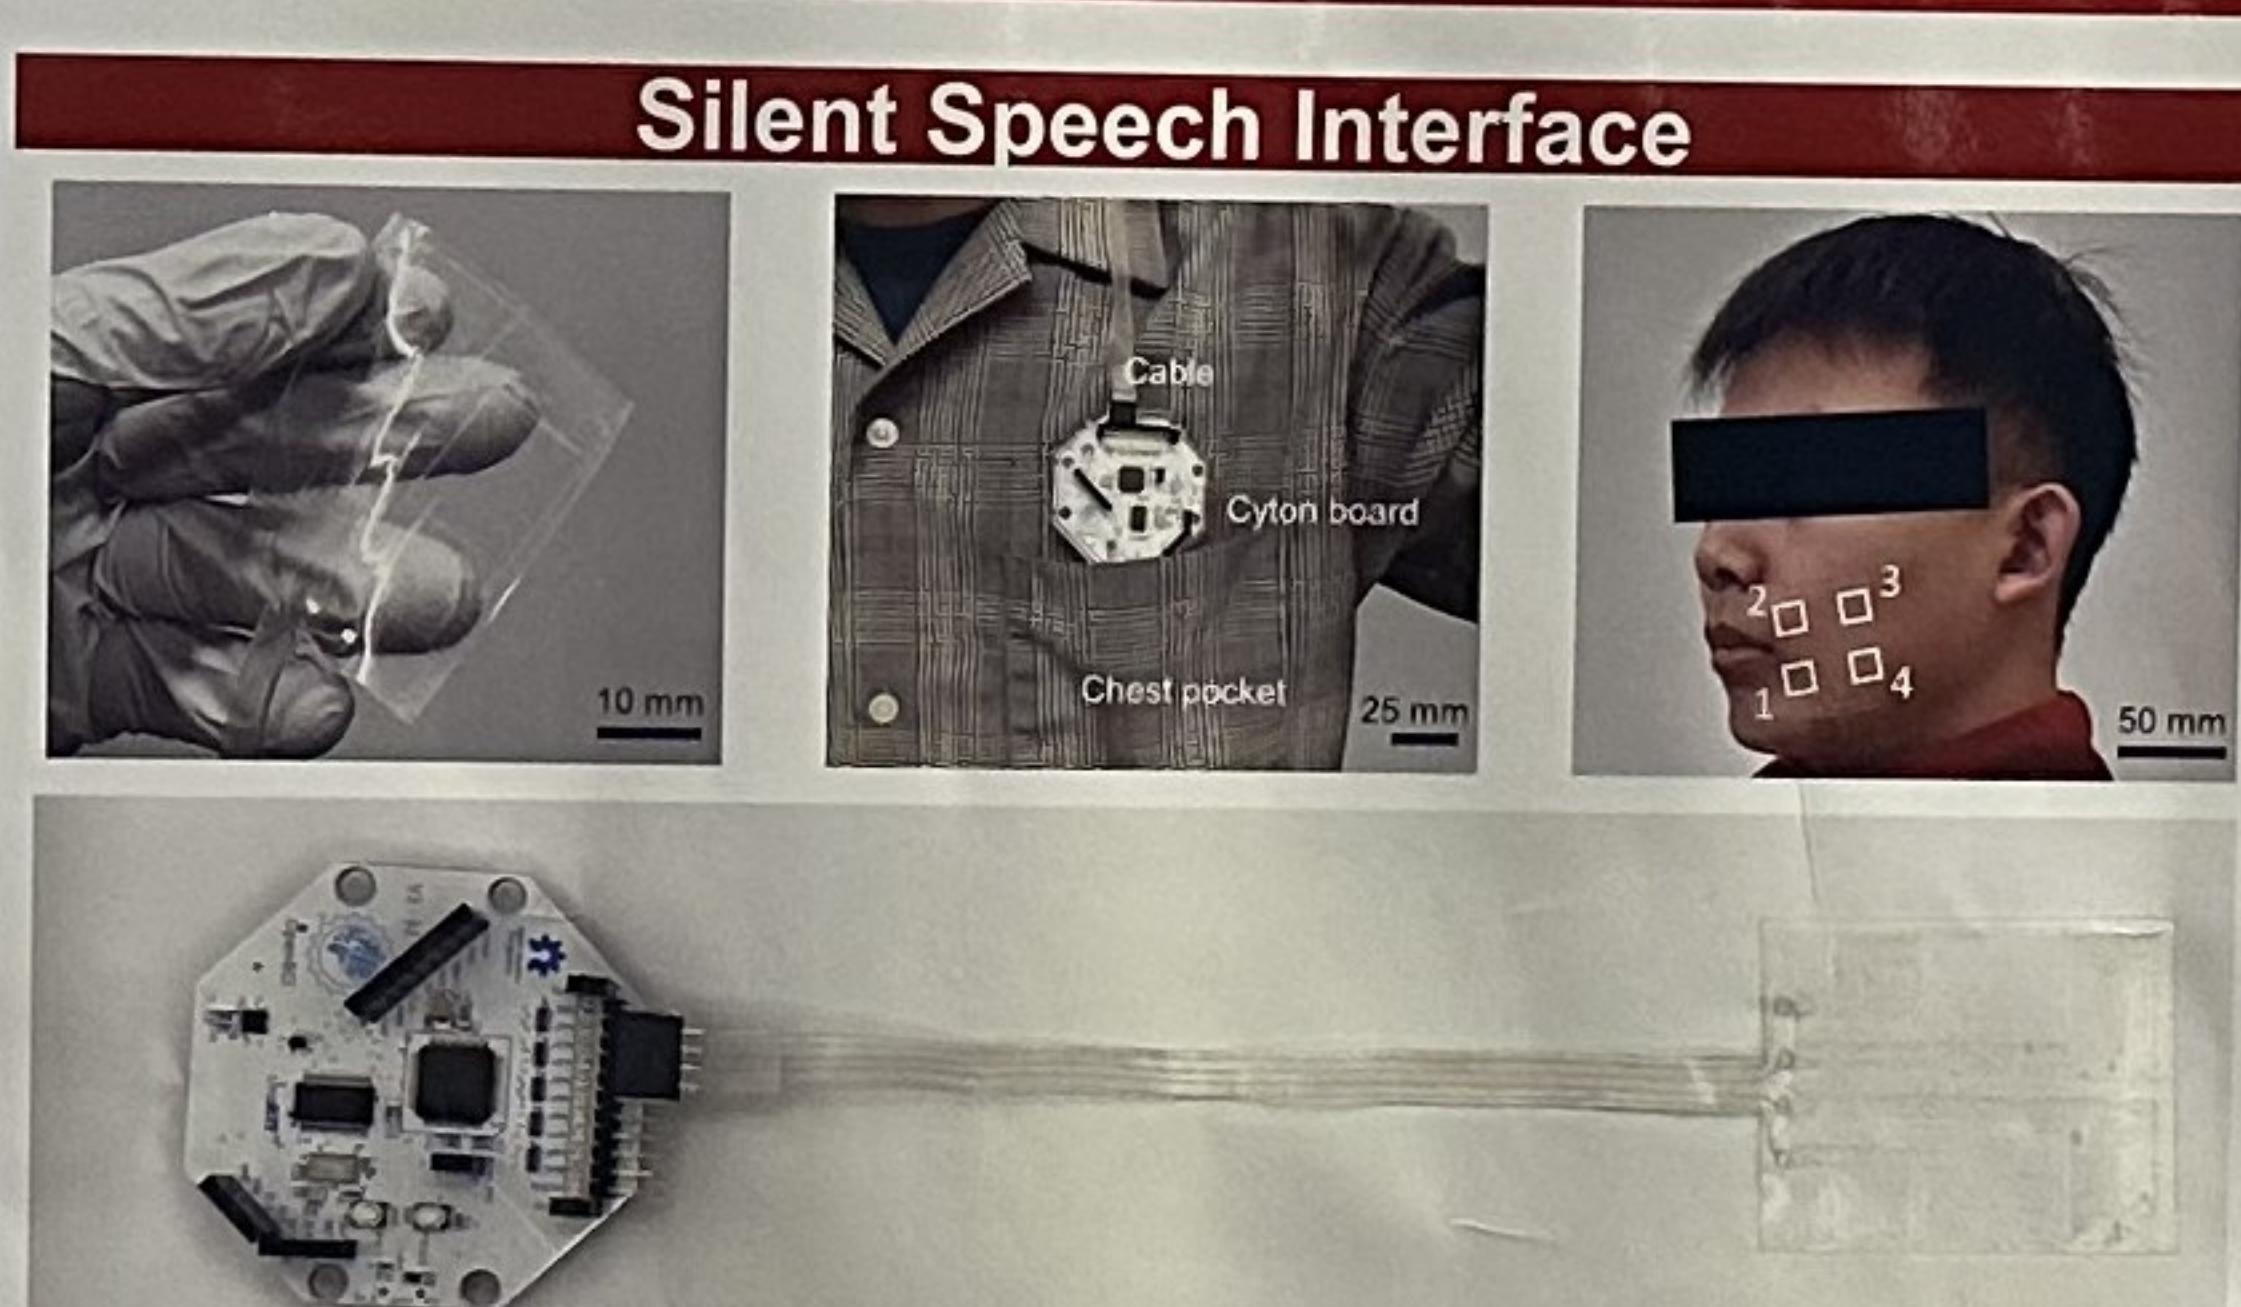

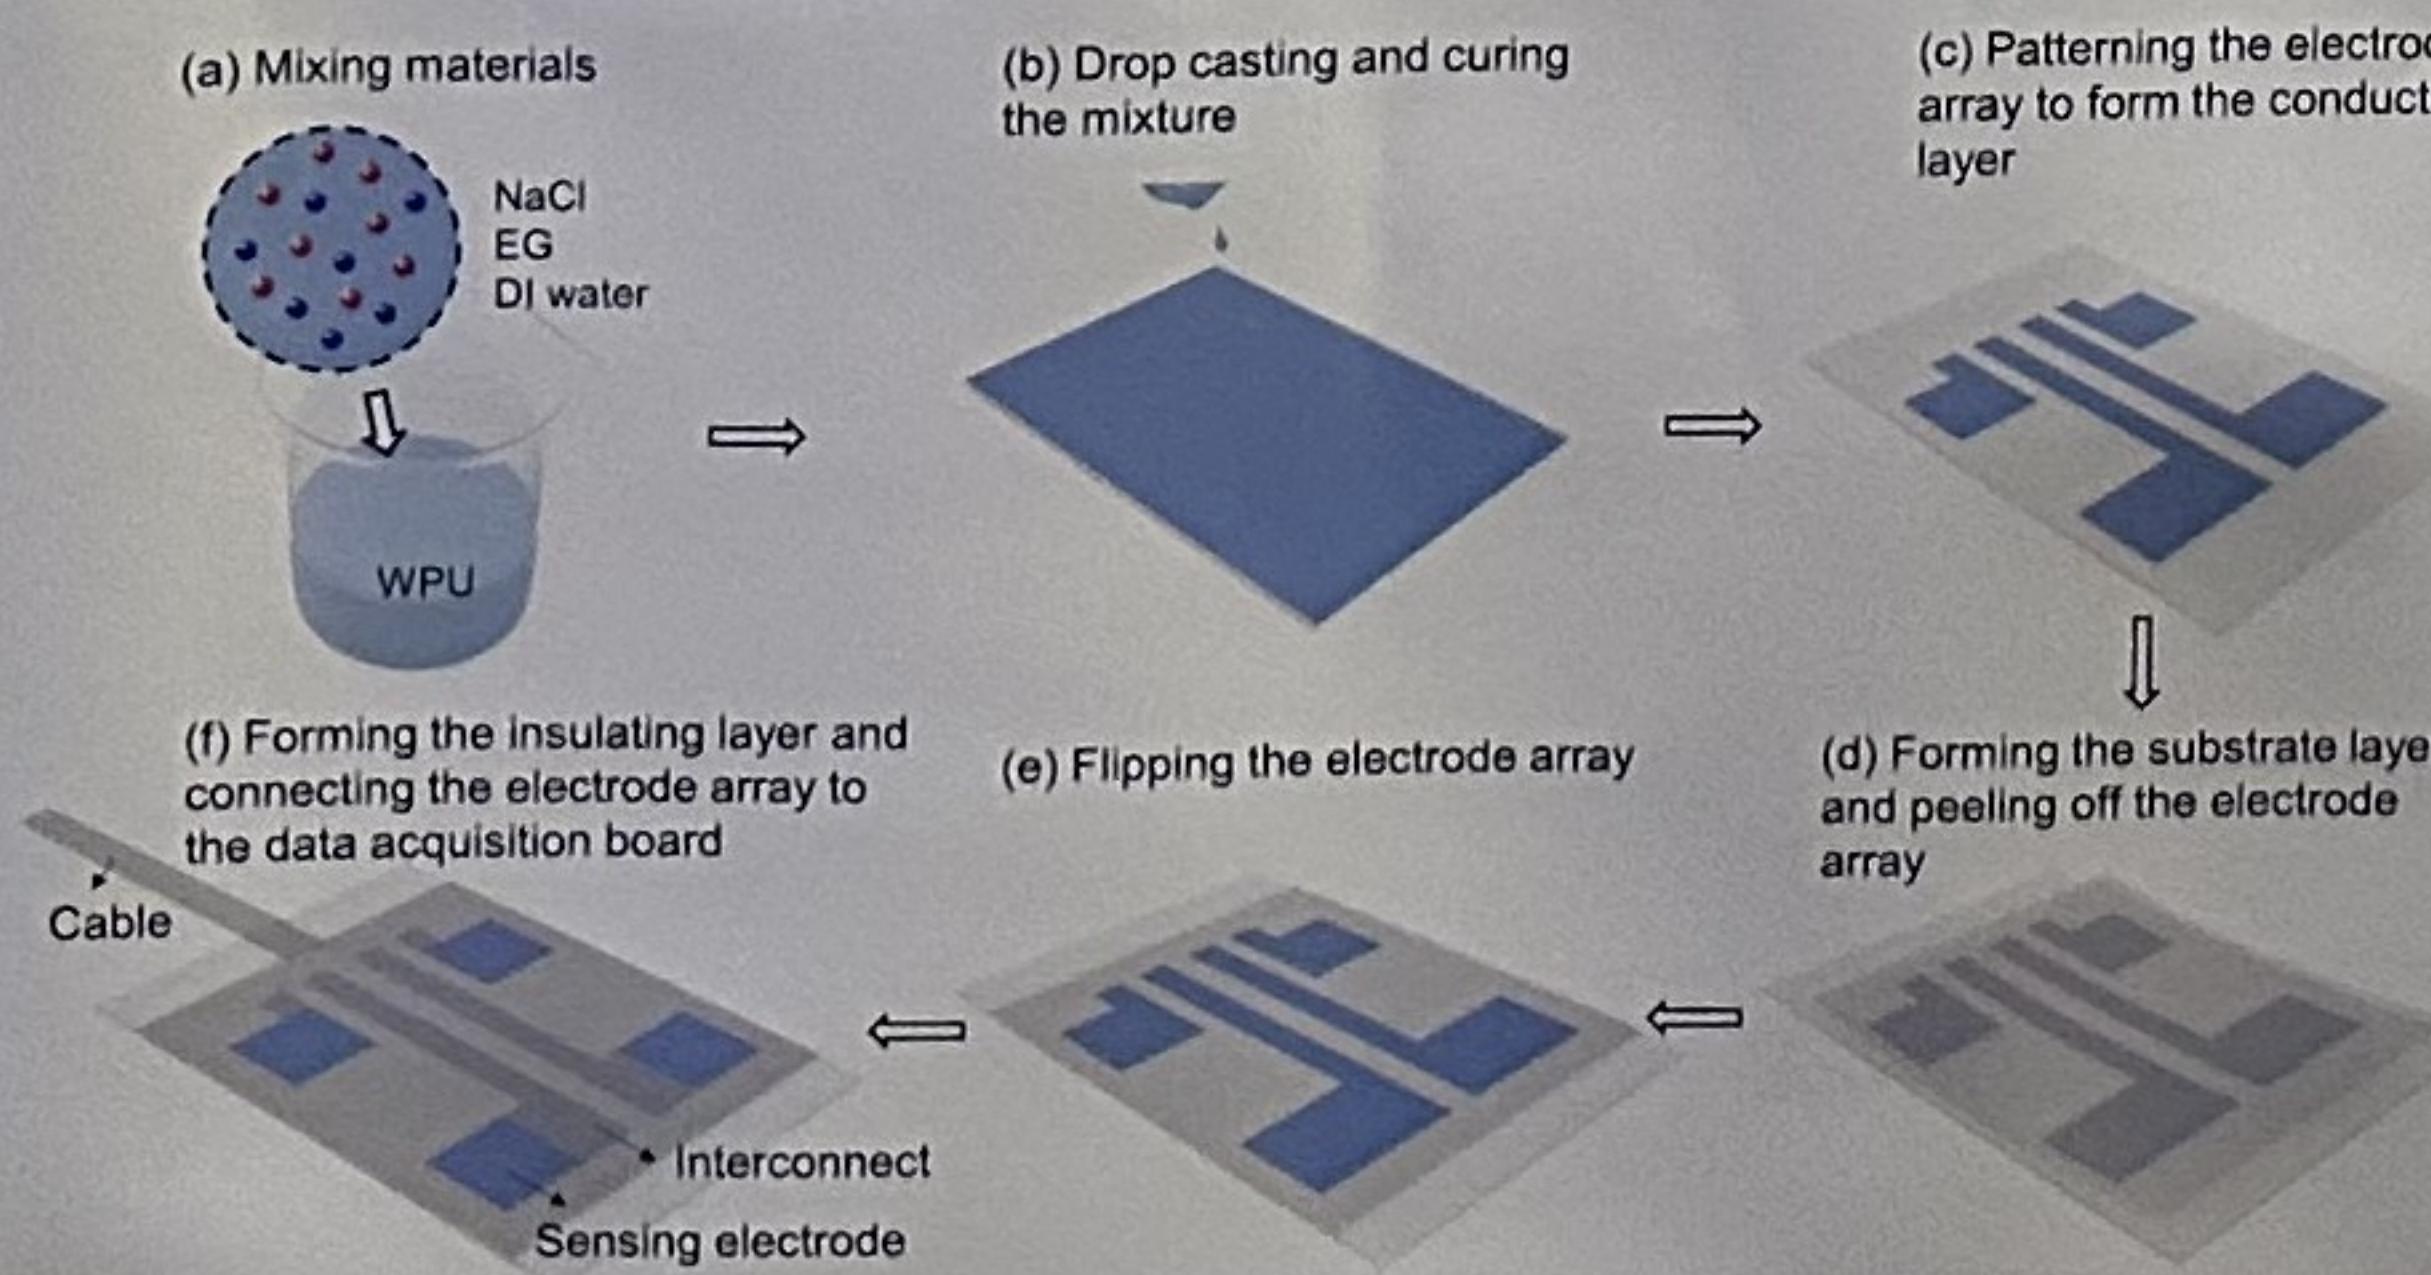

- Facial Electromyogram (EMG) signals exhibit a strong correlation with the contents and speaker characteristics of silent speech.
- Unobtrusive silent speech interfaces for human-robot collaborations are in demand.

Project Goal

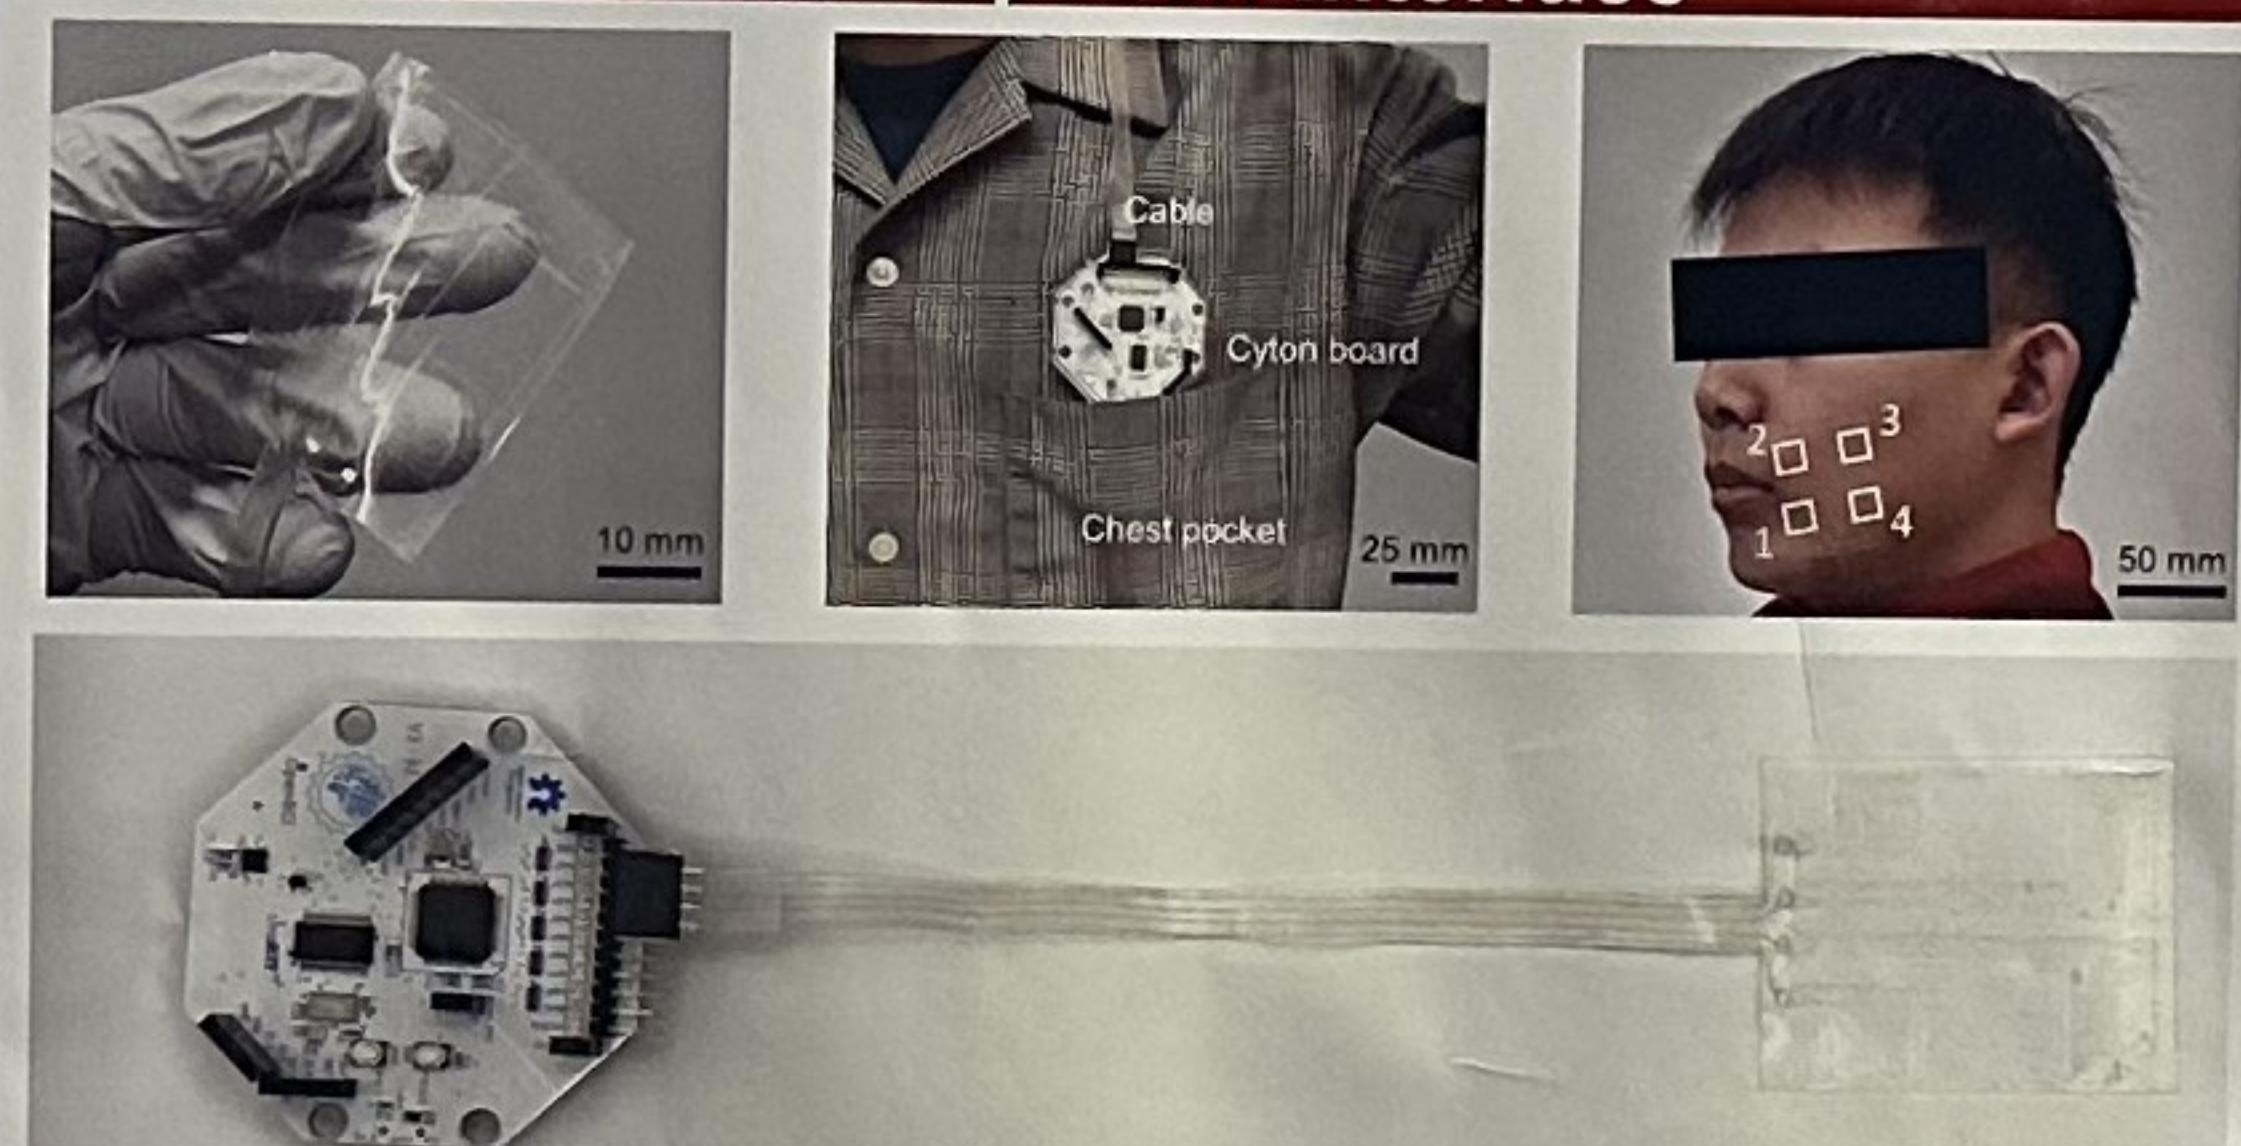

- Develop EMG-based silent speech interfaces and algorithms for speaker recognition and speech content recognition.
- Integrate the silent speech interface into a human-robot collaboration platform for assembling/disassembling processes.^[3]

Sensor Fabrication

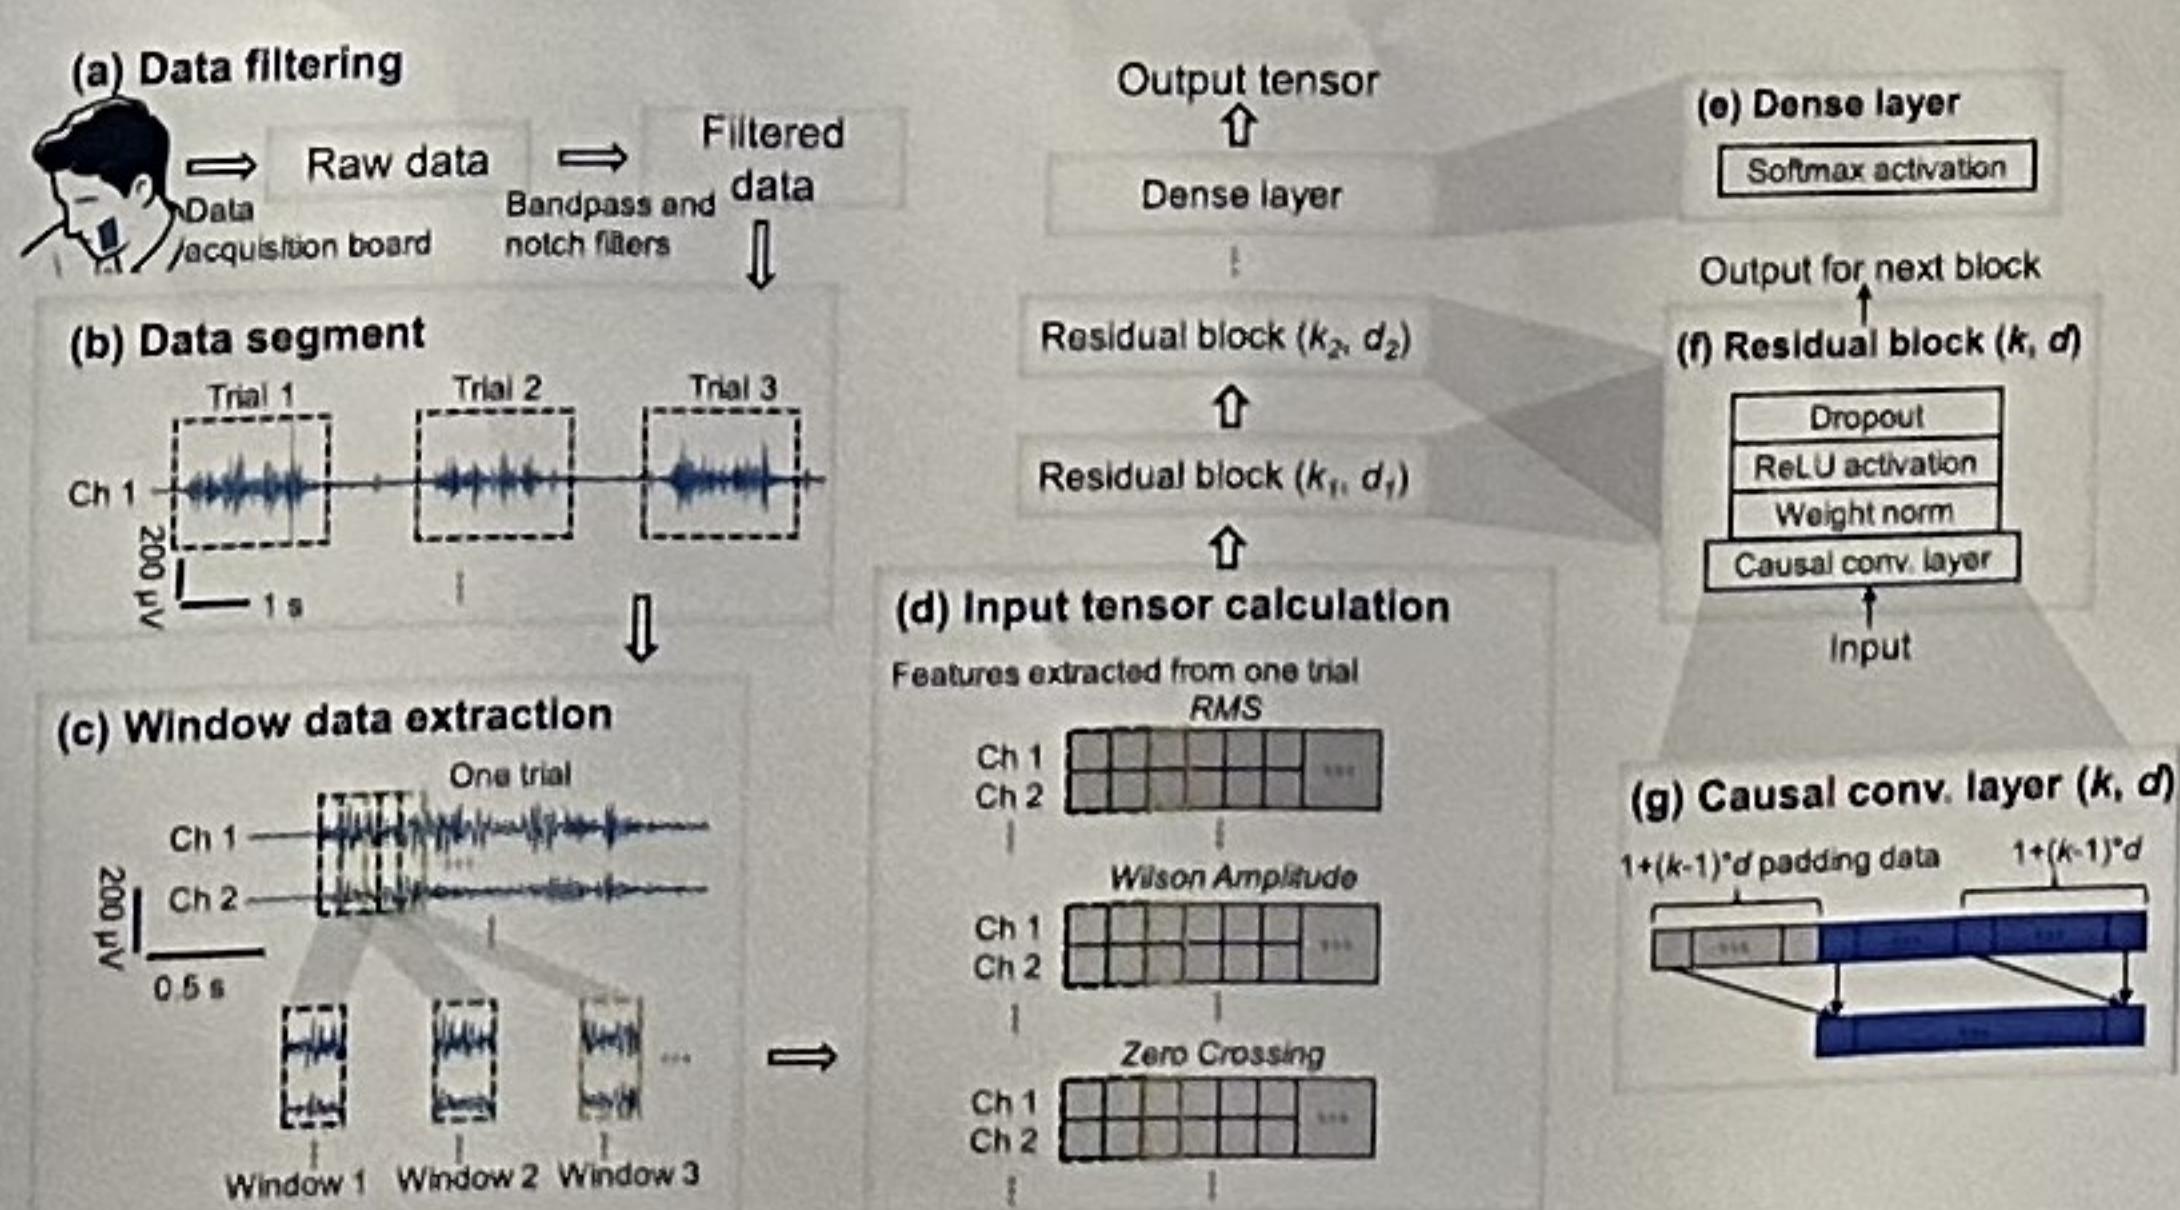

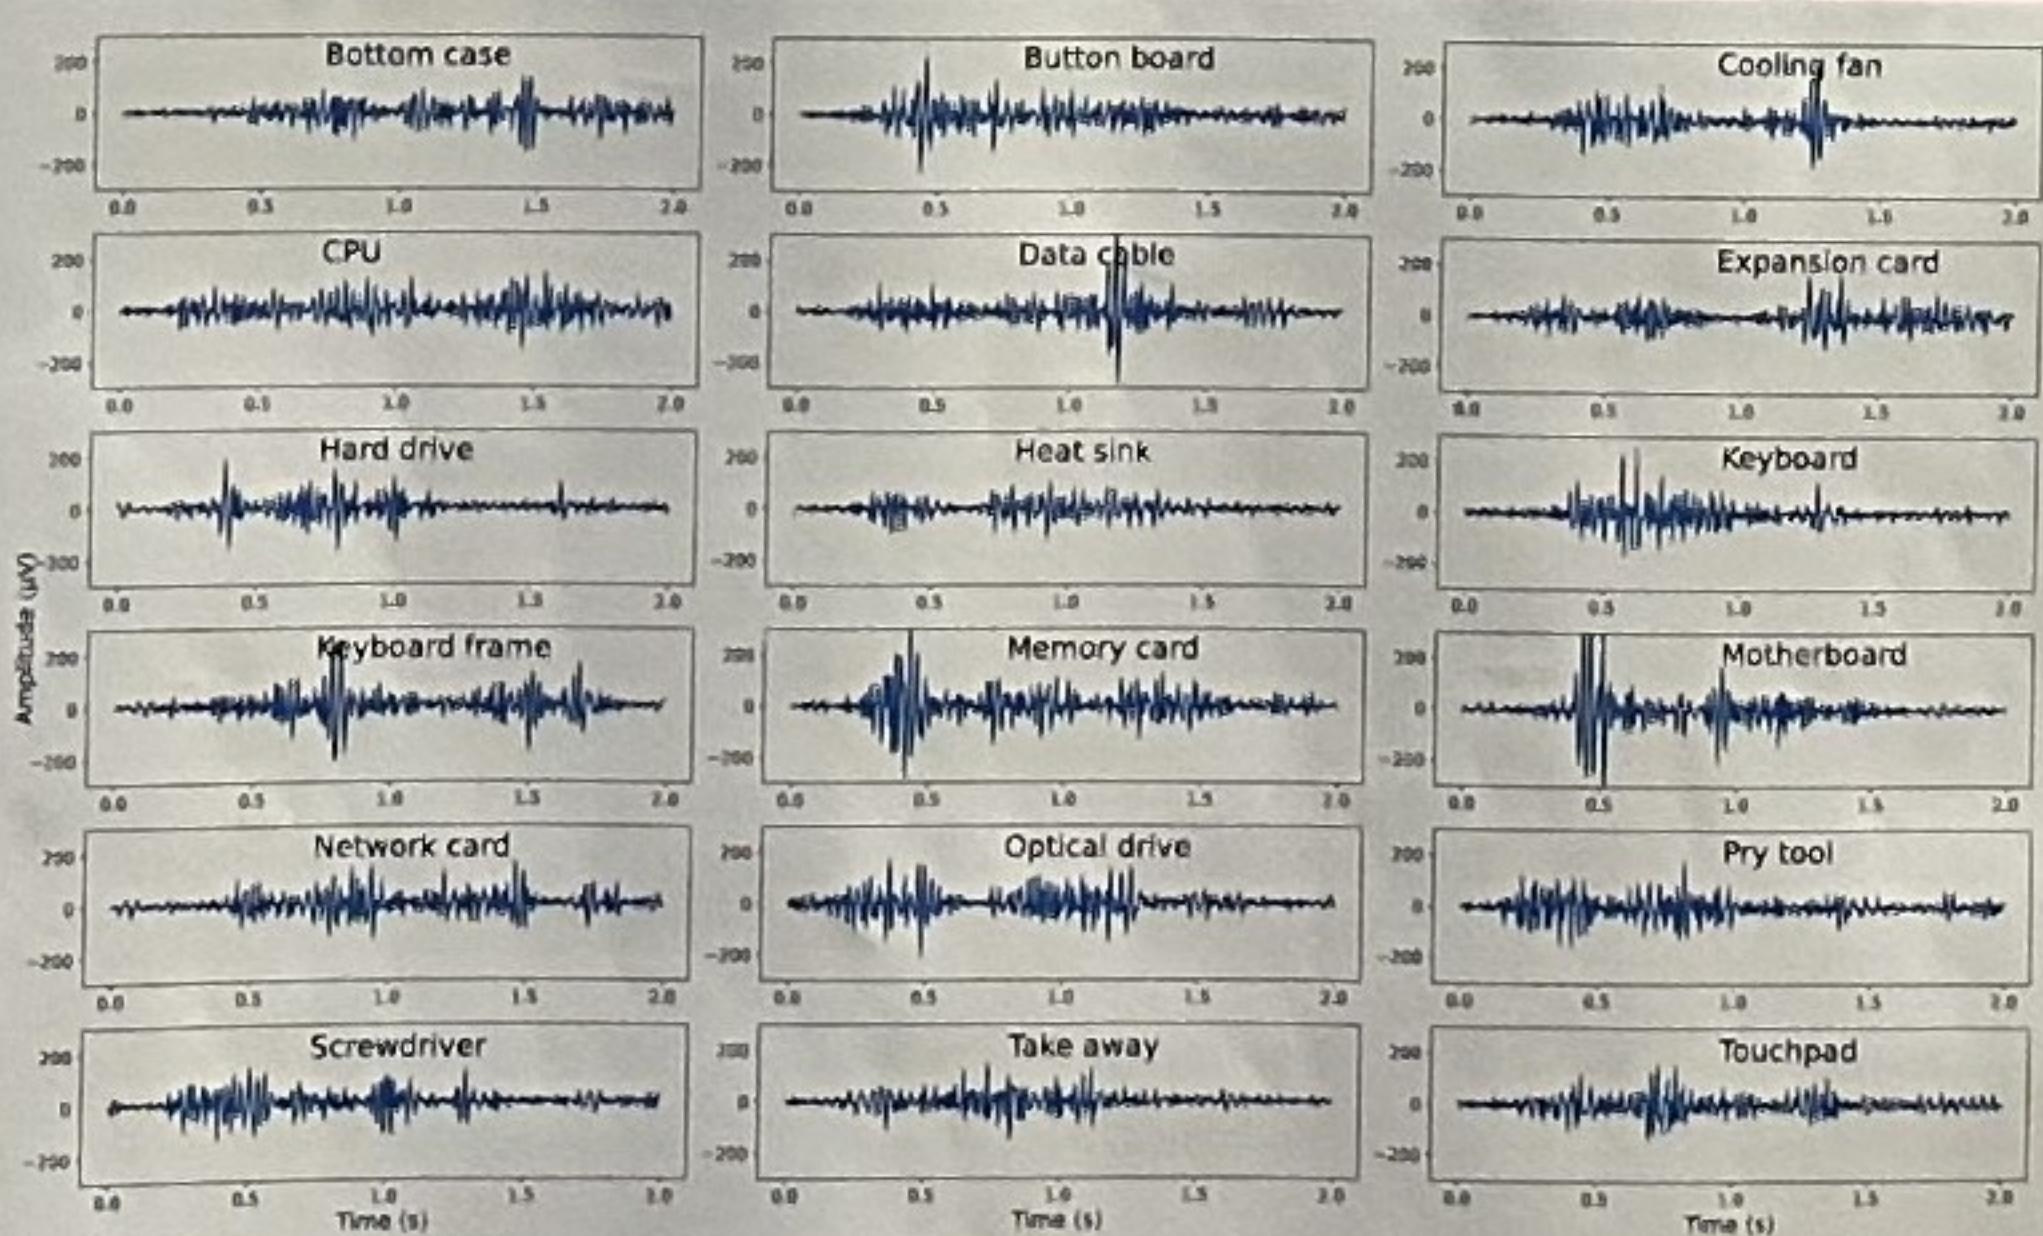

Silent Speech Interface

- The transparent electrode array is connected to the data acquisition board.

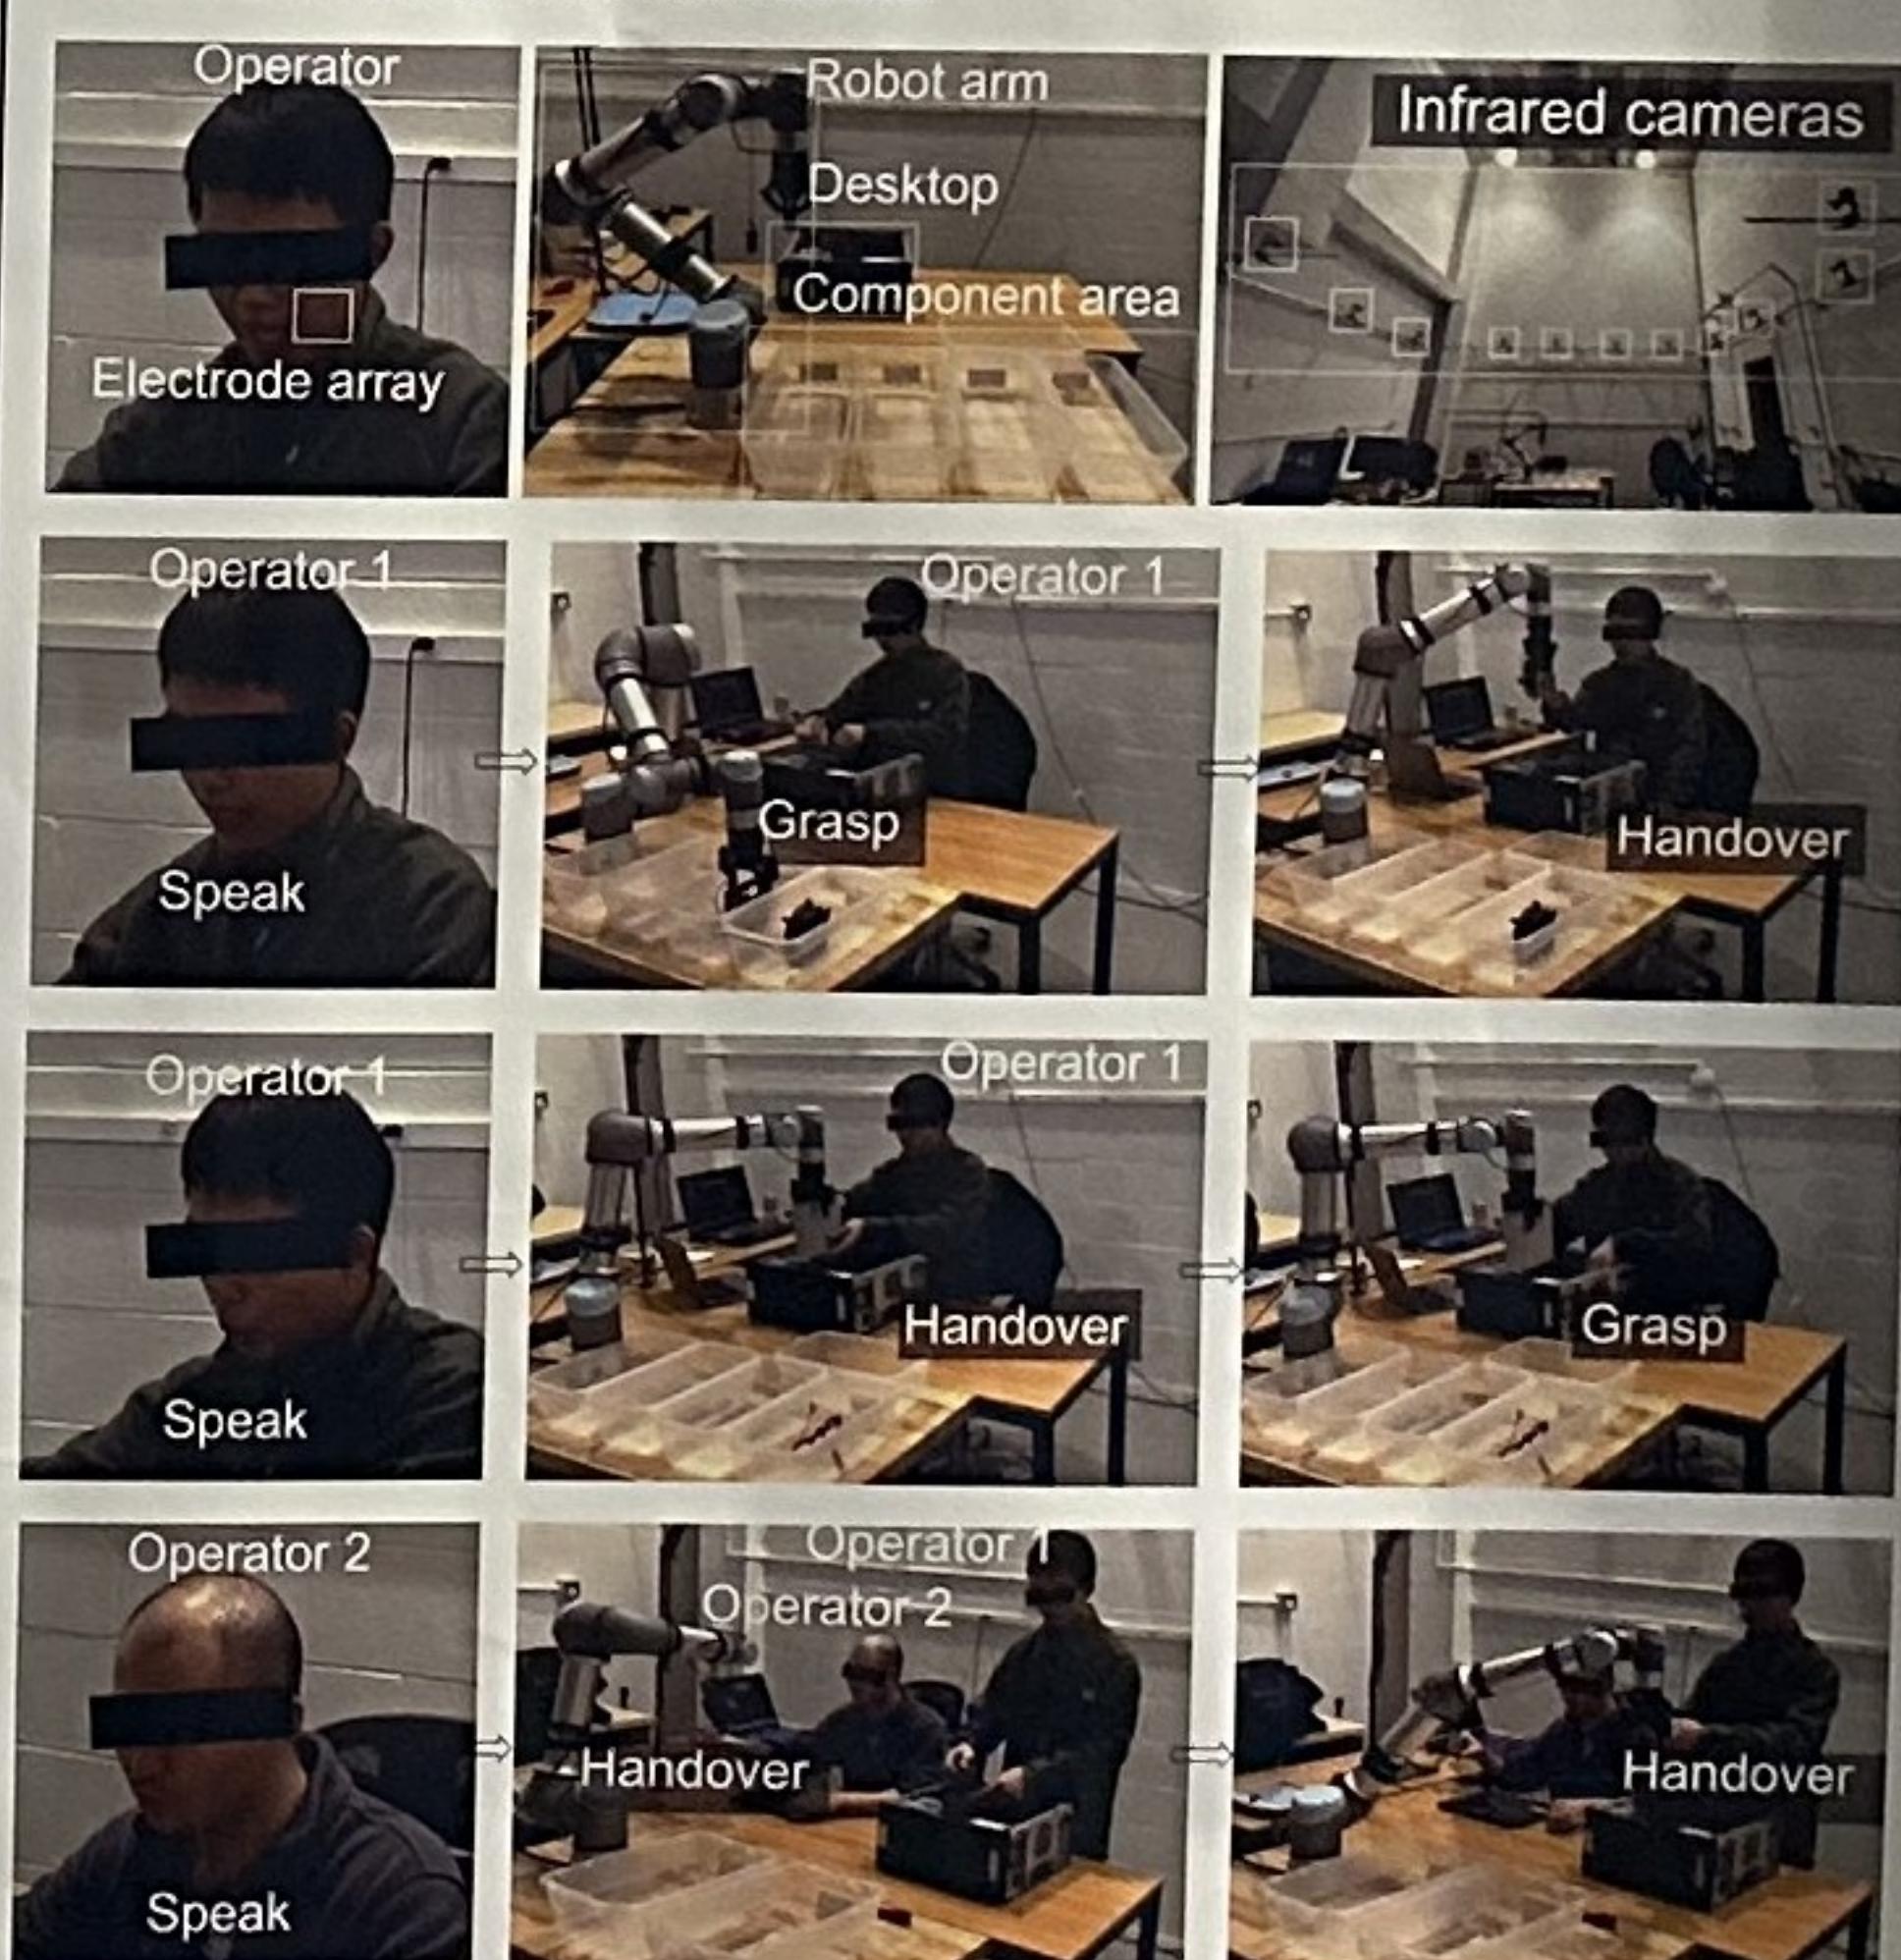

Algorithms for Signal Processing

- The temporal convolutional network is used for classifications of speakers and speech contents.

Applications

Human-robot Collaboration:

- Demonstrations illustrating applications of the developed silent speech interface for human-robot collaboration in assembling/disassembling computers.

Conclusion and Future Study

- This work presents an unobtrusive silent speech interface and its applications in human-robot collaboration.
- Looking forward, there is a need for phoneme-level silent speech recognition algorithms.

Acknowledgement

- The authors acknowledge NSF for financial support to this project through awards ECCS-2238363 and ECCS-2335863.
